## A Word on the Market by Pat Adams, CFA

Last week, the ECB did not disappoint by committing to buy 60 billion euro of sovereign debt per month beginning in March for the next year and a half. To throw a little cold water on the celebration, the Greek election was won, as expected, by the far left, which ran on anti- austerity. We would expect Greece to default on their debt. The euro has been extremely weak, and it is starting to look like the price of oil. The Europeans want to create inflation in their economy, driven by demand, not by a devalued currency that has little value.

Historically, when a country significantly devalues its currency, it is not a good thing for its economy or standard of living. It will be harder for U.S. based companies to compete with European companies. We are just guessing as to the exact level, but would expect some sort of panic in the financial markets if the euro falls below 100 versus the dollar.

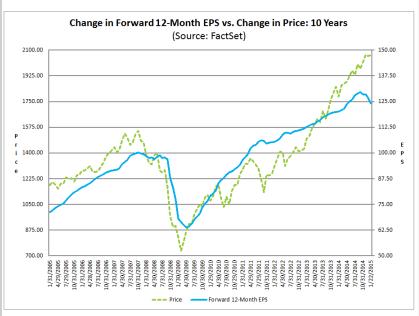

One Year Chart of the EUR vs. USD (yahoo.com)

As we have mentioned, earnings are under pressure with earnings growth for the 4th quarter now expected to only be .25% or flat. The pressure is coming from oil companies' earnings and multinational companies being impacted by currency translation. Below should be a familiar chart, the green line is the S&P 500 and the blue line is earnings growth.

Remember the year 2015 started with the consensus of "Wall Street" strategists expecting earnings to be up 7.5%. This trend is very important as the stock market correlates highly with earnings growth. A collapsing euro has a direct impact on U.S. companies' earnings growth. The spread between the stock market and the earnings growth rate is at a wide gap.
